

Physical and Environmental Security Policy

Approving Authority	Risk and Compliance Committee
Approval Date	March 2025
Advisor Chair	Head of InfoSec
Next Scheduled Review	March 2026
Description	The objective of this policy is outline the requirements of Lean Technologies with respect to Physical and Environmental Security across the various office locations, as well as meeting the requirements of the ISO 27001 A.11 Controls.

Contents

1. Scope	2
2. Responsibilities	3
3. Procedure	3
4. Secure Disposal or Re-use of Equipment	5
5. Unattended User Equipment, Clear Desk and Clear Screen	5
6. Measurement and Evaluation of Physical and Environmental Security Effectiveness	6

1. Scope

This policy is applicable to all areas within the scope of Lean Technologies, hereafter, Lean Tech's, Information Security Management System (ISMS).

2. Responsibilities

Every secure area has an owner and the owner is responsible for ensuring the prescribed controls are maintained and as otherwise specified below. Office Managers are the designated asset owners for the office which they are responsible for.

All employees, contractors, and third parties have responsibilities to comply with the requirements of this procedure as defined below.

3. Procedure

- The office has a secure perimeter which ensures that persons not in scope do not have ready access to secure areas. The premises are secured with physical access controls operated by the organisation. The building can only be accessed using a swipe card or combination lock, and outside office hours the door is also locked and controlled by an alarm.
- The front door is secured by key card. A member of Lean Tech staff meets the visitor in the reception area. Visitors (where appropriate) are escorted by their host whilst on-site. The offices are locked at all times.
- The building has a burglar alarm which is controlled by landlord during the office hours.
- Any unwanted visitors are requested to leave with recourse to the police if necessary should any visitor not leave when requested.
- The building is protected from environmental hazards due to its construction (brick). Fire retardant materials are used to minimise the spread of fire should a fire occur.
- Further the location of the building is such that environmental hazards such as floods are reduced. Fire protection measures include:
 - No smoking within the confines of the building
 - Minimisation of naked flames and other fire hazards such as potential fuels (e.g. cardboard) by good housekeeping measure
 - Fire detection systems consisting of smoke detectors and alarms

- Firefighting equipment such as portable fire extinguishers to all areas.
- Fire detection, alarms and firefighting equipment, are controlled by the LandLord. There is also a provision for emergency lighting to all areas and escape routes.
- The fire protection measures are checked regularly, and records are retained by the Office Manager.
- Access to secure areas/areas where open or confidential information is processed (including in conversation) or stored is restricted to authorised persons.
- Visitors and Third-party support personnel only have access to secure areas as and when required. Visitors and third-party support personnel are accompanied where appropriate unless they or their organisation on their behalf has signed an appropriate non-disclosure agreement.
- The host is responsible for ensuring that visitors and third-party contractors are aware of the security requirements and comply with these.
- Deliveries are made through the main reception area. Any incoming material destined for Lean Tech is checked as appropriate to ensure that it presents no threat. Any suspect items are quarantined and reported to the Office Manager prior to handling. Where appropriate, relevant authorities are informed of suspect items and action taken as indicated by such authority.
- Any item requiring registering as an asset will be so registered by the relevant department.
- Equipment siting and protection – all equipment is sited to minimise breach of security from external and environmental threats. Computer screens and other documents are positioned/angled to minimise opportunities for viewing by unauthorised persons. Screen protectors are used where appropriate.
- Supporting utilities – Power to the building is provided by supplies that enter the building from below ground.
- Cabling security- data cables enter the building below ground and are routed via protective trunking. Power cables enter underground. Internal cabling is set into conduit buried in walls, ceilings and floors to minimise interference. Power cabling is similarly protected.
- Power cables are separated from network cables to minimise interference.
- Equipment maintenance- infrastructure equipment (air conditioning systems, electrical wiring etc.) are subject to regular planned maintenance arranged by the Office Manager or by the landlord and relevant records of this maintenance are retained including faults and remedies as well as preventive and corrective maintenance.
- All repair and maintenance is conducted by suitable qualified and authorised personnel or subcontractors.
- Security of equipment off-premises- all equipment allowed off-site is authorised by management. Certain equipment (e.g. laptops or mobile phones) are provided as part of a staff member's

position and in this case such authorisation is granted automatically as part of the job holder's duties.

- Any other equipment taken off site requires the IT or Office Manager to approve such removal. This approval may be granted verbally.
- Equipment (including media) taken off site must not be left unattended in a public place (e.g. airport, railway station etc.). Laptops/Notebook computers should be carried as hand luggage and disguised if possible during travel. Any relevant advice from manufacturers should be considered such as susceptibility and protection against strong magnetic fields.
- Home workers may be subject to a risk assessment to identify any relevant risks and the necessary controls. Home workers should comply with the clear desk and clear screen policies, ensure access is controlled as if in the office and have appropriate security measures (e.g. lockable files, secure shredding facilities) as well as secure communications via VPN or similar with the office.
- The company insurance policy provides adequate cover for equipment taken off site (Globally) except for items that are self-insured where relevant.

4. Secure Disposal or Re-use of Equipment

- Hard disks must be cleared of all software and all information prior to disposal or re-use.
- Lean's IT department is responsible for the secure disposal of storage media and the disposal of all information processing equipment is routed through the office. A record/certificate is retained showing what media was destroyed, disposed of, and when. The asset inventory is adjusted, if appropriate, once the asset has been disposed of.
- Hard disks are securely wiped using a full disk reimaging system.
- Devices containing Confidential/Restricted information are physically destroyed prior to disposal. They are destroyed in a manner that guarantees they can never be re-used.
- Devices containing Confidential/Restricted information are regularly and securely backed up. In the event they are damaged beyond repair, they are subjected to the same physical destruction.
- Portable or removable storage media of any description are physically destroyed prior to disposal.
- When jurisdiction does not stipulate disposal of equipment Lean Tech shall dispose of the equipment in line with its risk assessment.
- Documents which are to be destroyed are shredded by their owners or disposed of as confidential waste.

5. Unattended User Equipment, Clear Desk and Clear Screen

- Where appropriate, paper and computer media is stored in suitable locked cabinets when not in use.
- Commercially sensitive business information, including papers etc, are locked away when not required.
- Laptops and printers are not left logged on when unattended and are protected by passwords.
- All information, especially commercially sensitive information, when printed, is cleared from printers immediately.
- Laptops are protected by passwords, screen savers or equivalent controls when not in use. Laptops have a screen saver enabled after 5 minutes' inactivity.
- When leaving their desks for any length of time (e.g. at the end of the working day) staff should clear away documents and not leave their laptop unattended.
- Staff should lock their screen when leaving their desk/computer.

6. Measurement and Evaluation of Physical and Environmental Security Effectiveness

To ensure the continuous effectiveness of our physical and environmental security controls, the following key performance indicators (KPIs) shall be monitored and reviewed regularly:

1. Number of Physical Security Access Reviews Conducted – Periodic reviews of physical access logs and permissions to ensure only authorized personnel have access to restricted areas.
2. Number of Secure Erases Performed – Tracking and verification of secure data erasure procedures for decommissioned storage devices, ensuring compliance with data sanitization standards.

These KPIs shall be reviewed on a quarterly basis, and any identified gaps or inefficiencies will be addressed through corrective actions to enhance physical and environmental security controls.
